Customer Reviews

Money well spent! Pulmonologists are now trained to rely on EBUS and EUS fine needle aspiration techniques to stage their lung cancer patients in the least invasive manner. EBUS-TBNA has now arrived at our rural community hospital and our pathology group has had to hit the ground running. This is a fabulous book that covers all aspects of this approach. It provides a good review from the pulmonologists' perspective, offering clinical insights and ample details regarding the procedure and

expected outcomes. Moreover, this text explores in exhaustive depth the role of the cytology department so that we can help ensure the best results. This is an ideal text for the pathologist, cytologist and support team. There is an excellent chapter detailing rapid on site evaluation (ROSE) and several great chapters which review the gamut of cytologic findings that may be encountered in real life situations. If you are new to EBUS/EUS cytology then you NEED this book.

You won't be learning much about EBUS in this book. They don't even show how the LN appear by US. There is only one bad picture about how LN appears and it is not even a clear one.. If you want to learn how to perform EBUS, how to recognize the anatomy, landmarks and how to target a nodule get another book. Again they dedicated several chapters to cytology and this what they should sell the book as; EBUS for cytologist!
